The applicant proposes to conduct health assessments of bottlenose dolphins in Florida's Indian River Lagoon system by capturing, sampling, and releasing up to 40 dolphins per year. Females with calves less than one year old would not be captured. Captured dolphins would receive a complete clinical workup including: measurements, weight, photographs, sample collection, freeze brand, and ultrasound. All captured animals would receive a roto tag. Up to ten animals per year would also receive a VHF tag. An experienced veterinarian would be on site during captures and the dolphins' vital signs would be closely monitored. Processing would take about forty minutes. Individual dolphins would only be sampled once per year. Samples would be analyzed to examine a variety of health topics such as: infectious diseases, immune status, contaminant exposure, antibiotic resistance, and genetics. An additional 400 dolphins per year may be harassed during pre- and post-capture surveys. Specific goals of the research are to: (1) evaluate dolphin health from individual, population, and comparative perspectives, (2) apply classical and novel methods and diagnostic tools to

detect and assess anthropogenic and environmental factors that affect dolphins, and (3) develop predictive models to evaluate conservation and management strategies. The permit would be valid for a period of five years.

Concurrent with the publication of this notice in the **Federal Register**, NMFS is forwarding copies of the application to the Marine Mammal Commission and its Committee of Scientific Advisors.

Dated: May 15, 2009.
