Endangered Shortnose Sturgeon
(*Acipenser brevirostrum*)

Application 1360

The applicant hypothesizes that the recovery of shortnose sturgeon on the Hudson River occurred due to one or several strong year-classes following nursery system recovery to normoxia after 1977. The applicant proposes to test this hypothesis by determining the ages of shortnose sturgeon caught in the Hudson river by interpreting annulus of pectoral fin spines. The method will be tested on 10 captive shortnose sturgeon from seven age classes (70 total) from US Fish and Wildlife Service Warm Springs Fish Hatchery, Georgia. The applicant will clip a 1cm section from the primary spine of one pectoral fin near the point of articulation. After this has been tested in hatchery fish, the applicant proposes to capture shortnose sturgeon in the Hudson River with gillnets, handle, measure, check for tags, tag, passive integrated transponder tag, sex (by external or fiberoptic examination), and release. The applicant proposes to take 190 shortnose sturgeon in 2002 and 480 in 2003.

AmeriCorps Attrition Overview Study

I. Background

An analysis of data on attrition will help the Corporation revise strategies of program development, recruitment, training, and supervision in order to reduce the rate of attrition.

This study will entail telephone interviews of approximately 30 minutes in length with 1000 former AmeriCorps members. It will provide indicators of program success, differences among programs in retaining participants, individual characteristics of participants who tend to drop out, and combinations of member and program characteristics that appear to work well or work poorly.
