

inch gauge (psig) to clean gas pipes. A total of 15 natural gas blows were completed intermittently over approximately four hours through a number of open pipe ends which were located less than 20 feet off the ground.

Efforts were made to eliminate or control potential ignition sources outside the power generation building. However, many ignition sources existed inside the building: electrical power to the building was on, welders were actively working, and diesel-fueled heaters were running.

Initial calculations by CSB investigators reveal that approximately 400,000 standard cubic feet of natural gas were released to the atmosphere near the building in the final ten minutes before the blast. Just over 2 million standard cubic feet of gas were released in total over the course of the morning. At approximately 11:15 a.m., the released natural gas found an ignition source and exploded.

The meeting will be videotaped and an official transcript will be included in the investigative file. All staff presentations are preliminary and are intended solely to allow the Board to consider the issues and factors involved in this case in a public forum. No factual analyses, conclusions, findings or recommendations of the staff should be considered final. Only after the Board has considered and approved the urgent recommendations will there be an approved final record.

Christopher W. Warner,
General Counsel.
