

# Rules and Regulations

Federal Register

Vol. 73, No. 77

Monday, April 21, 2008

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents. Prices of new books are listed in the first FEDERAL REGISTER issue of each week.

## DEPARTMENT OF AGRICULTURE

### Agricultural Marketing Service

#### 7 CFR Part 985

[Docket Nos. AMS-FV-07-0135; FV08-985-2 FR]

#### Marketing Order Regulating the Handling of Spearmint Oil Produced in the Far West; Salable Quantities and Allotment Percentages for the 2008–2009 Marketing Year

**AGENCY:** Agricultural Marketing Service, USDA.

**ACTION:** Final rule.

**SUMMARY:** This rule establishes the quantity of spearmint oil produced in the Far West, by class that handlers may purchase from, or handle for, producers during the 2008–2009 marketing year, which begins on June 1, 2008. This rule establishes salable quantities and allotment percentages for Class 1 (Scotch) spearmint oil of 993,067 pounds and 50 percent, respectively, and for Class 3 (Native) spearmint oil of 1,184,748 pounds and 53 percent, respectively. The Spearmint Oil Administrative Committee (Committee), the agency responsible for local administration of the marketing order for spearmint oil produced in the Far West, recommended these limitations for the purpose of avoiding extreme fluctuations in supplies and prices to help maintain stability in the spearmint oil market.

**DATES:** *Effective Date:* April 22, 2008.

**FOR FURTHER INFORMATION CONTACT:** Susan M. Coleman, Marketing Specialist or Gary D. Olson, Regional Manager, Northwest Marketing Field Office, Marketing Order Administration Branch, Fruit and Vegetable Programs, AMS, USDA; Telephone: (503) 326–2724; Fax: (503) 326–7440; or E-mail: [Sue.Coleman@usda.gov](mailto:Sue.Coleman@usda.gov) or [GaryD.Olson@usda.gov](mailto:GaryD.Olson@usda.gov).

Small businesses may request information on complying with this regulation by contacting Jay Guerber, Marketing Order Administration Branch, Fruit and Vegetable Programs, AMS, USDA, 1400 Independence Avenue, SW., STOP 0237, Washington, DC 20250–0237; Telephone: (202) 720–2491, Fax: (202) 720–8938, or E-mail: [Jay.Guerber@usda.gov](mailto:Jay.Guerber@usda.gov).

**SUPPLEMENTARY INFORMATION:** This final rule is issued under Marketing Order No. 985 (7 CFR part 985), as amended, regulating the handling of spearmint oil produced in the Far West (Washington, Idaho, Oregon, and designated parts of Nevada and Utah), hereinafter referred to as the “order.” This order is effective under the Agricultural Marketing Agreement Act of 1937, as amended (7 U.S.C. 601–674), hereinafter referred to as the “Act.”

The Department of Agriculture (USDA) is issuing this rule in conformance with Executive Order 12866.

This final rule has been reviewed under Executive Order 12988, Civil Justice Reform. Under the marketing order now in effect, salable quantities and allotment percentages may be established for classes of spearmint oil produced in the Far West. This final rule establishes the quantity of spearmint oil produced in the Far West, by class, which may be purchased from or handled for producers by handlers during the 2008–2009 marketing year, which begins on June 1, 2008. This rule will not preempt any State or local laws, regulations, or policies, unless they present an irreconcilable conflict with this rule.

The Act provides that administrative proceedings must be exhausted before parties may file suit in court. Under section 608c(15)(A) of the Act, any handler subject to an order may file with USDA a petition stating that the order, any provision of the order, or any obligation imposed in connection with the order is not in accordance with law and request a modification of the order or to be exempted therefrom. A handler is afforded the opportunity for a hearing on the petition. After the hearing, USDA would rule on the petition. The Act provides that the district court of the United States in any district in which the handler is an inhabitant, or has his or her principal place of business, has jurisdiction to review USDA’s ruling on

the petition, provided an action is filed not later than 20 days after the date of the entry of the ruling.

Pursuant to authority in §§ 985.50, 985.51, and 985.52 of the order, the Committee, with seven of its eight members present, met on October 17, 2007, and recommended salable quantities and allotment percentages for both classes of oil for the 2008–2009 marketing year. The Committee unanimously recommended the establishment of a salable quantity and allotment percentage for Scotch spearmint oil of 993,067 pounds and 50 percent, respectively. For Native spearmint oil, the Committee unanimously recommended the establishment of a salable quantity and allotment percentage of 1,184,748 pounds and 53 percent, respectively.

This final rule limits the amount of spearmint oil that handlers may purchase from, or handle for, producers during the 2008–2009 marketing year, which begins on June 1, 2008. Salable quantities and allotment percentages have been placed into effect each season since the order’s inception in 1980.

The U.S. production of Scotch spearmint oil is concentrated in the Far West, which includes Washington, Idaho, and Oregon and a portion of Nevada and Utah. Scotch spearmint oil is also produced in the Midwest states of Indiana, Michigan, and Wisconsin, as well as in the States of Montana, South Dakota, North Dakota, and Minnesota. The production area covered by the marketing order currently accounts for approximately 62 percent of the annual U.S. sales of Scotch spearmint oil.

When the order became effective in 1980, the Far West had 72 percent of the world’s sales of Scotch spearmint oil. While the Far West is still the leading producer of Scotch spearmint oil, its share of world sales is now estimated to be about 46 percent. This loss in world sales for the Far West region is directly attributed to the increase in global production. Other factors that have played a significant role include the overall quality of the imported oil and technological advances that allow for more blending of lower quality oils. Such factors have provided the Committee with challenges in accurately predicting trade demand for Scotch oil. This, in turn, has made it difficult to balance available supplies with demand and to achieve the

Committee's overall goal of stabilizing producer and market prices.

The marketing order has continued to contribute to price and general market stabilization for Far West producers. The Committee, as well as spearmint oil producers and handlers attending the October 17, 2007, meeting, estimated that the 2007–2008 producer price for Scotch oil would be \$14.00 to \$15.00 per pound. However, there is very little forward contracting being done at the present time and producers are wary of doing so because of significant increases in their cost of production. This producer price is approaching the cost of production for most producers as indicated in a study from the Washington State University Cooperative Extension Service (WSU), which estimates production costs to be between \$13.50 and \$15.00 per pound. However, this study was completed in 2001 and fuel costs alone have doubled in price. The rises in fuel costs have also increased other petroleum based products, such as tires, fertilizer, and chemicals, which also increase production costs.

This low level of producer returns has caused an overall reduction in acreage. When the order became effective in 1980, the Far West region had 9,702 acres of Scotch spearmint. The Committee reported that the 2007–2008 acreage of Scotch was 6,528 acres, which resulted in 810,675 pounds of Scotch oil.

The Committee recommended the 2008–2009 Scotch spearmint oil salable quantity (993,067 pounds) and allotment percentage (50 percent) utilizing sales estimates for 2008–2009 Scotch spearmint oil as provided by several of the industry's handlers, as well as historical and current Scotch spearmint oil sales levels. The Committee is estimating that about 920,000 pounds of Scotch spearmint oil, on average, may be sold during the 2008–2009 marketing year. When considered in conjunction with the estimated zero carry-in of oil on June 1, 2008, the recommended salable quantity of 993,067 pounds results in a total available supply of Scotch spearmint oil next year of 993,067 pounds.

The recommendation for the 2008–2009 Scotch spearmint oil volume regulation is consistent with the Committee's stated intent of keeping adequate supplies available at all times, while attempting to stabilize prices at a level adequate to sustain the producers. Furthermore, the recommendation takes into consideration the industry's desire to compete with less expensive oil produced outside the regulated area.

Although Native spearmint oil producers are facing market conditions similar to those affecting the Scotch spearmint oil market, the market share is quite different. Over 90 percent of the U.S. production of Native spearmint is produced within the Far West production area. Also, most of the world's supply of Native spearmint is produced in the United States.

The supply and demand characteristics of the current Native spearmint oil market, combined with the stabilizing impact of the marketing order, have kept the price relatively steady. The average price for the five-year period ending in 2006 is \$9.80, which is \$0.06 higher than the average price for the ten-year period (1997–2006) of \$9.74. The Committee considers these levels too low for the majority of producers to maintain viability. The WSU study referenced earlier indicates that the cost of producing Native spearmint oil ranges from \$10.26 to \$10.92 per pound.

Similar to Scotch, the low level of producer returns has also caused an overall reduction in Native spearmint acreage. When the order became effective in 1980, the Far West region had 12,153 acres of Native spearmint. The Committee reported that the 2007–2008 acreage of Native spearmint was 8,436 acres, which resulted in 1,221,238 pounds of Native oil.

The Committee recommended the 2008–2009 Native spearmint oil salable quantity (1,184,748 pounds) and allotment percentage (53 percent) utilizing sales estimates for 2008–2009 Native oil as provided by several of the industry's handlers, as well as historical and current Native spearmint oil sales levels. The Committee is estimating that about 1,250,000 pounds of Native spearmint oil, on average, may be sold during the 2008–2009 marketing year. When considered in conjunction with the estimated carry-in of 56,433 pounds of oil on June 1, 2008, the recommended salable quantity of 1,184,748 pounds results in a total available supply of Native spearmint oil next year of about 1,241,181 pounds.

The Committee's method of calculating the Native spearmint oil salable quantity and allotment percentage continues to primarily utilize information on price and available supply as they are affected by the estimated trade demand. The Committee's stated intent is to make adequate supplies available to meet market needs and improve producer prices.

The Committee believes that the order has contributed extensively to the stabilization of producer prices, which

prior to 1980 experienced wide fluctuations from year to year. According to the National Agricultural Statistics Service, for example, the average price paid for both classes of spearmint oil ranged from \$4.00 per pound to \$11.10 per pound during the period between 1968 and 1980. Prices since the order's inception, the period from 1980 to 2006, have generally stabilized at an average price of \$12.69 per pound for Scotch spearmint oil and \$9.89 per pound for Native spearmint oil.

The Committee based its recommendation for the proposed salable quantity and allotment percentage for each class of spearmint oil for the 2008–2009 marketing year on the information discussed above, as well as the data outlined below.

#### (1) Class 1 (Scotch) Spearmint Oil

(A) Estimated carry-in on June 1, 2008—0 pounds. This figure is the difference between the revised 2007–2008 marketing year total available supply of 816,718 pounds and the estimated 2007–2008 marketing year trade demand of 816,718 pounds.

(B) Estimated trade demand for the 2008–2009 marketing year—920,000 pounds. This figure was based on input from producers at six Scotch spearmint oil production area meetings held in September 2007, as well as estimates provided by handlers and other meeting participants at the October 17, 2007, meeting. The average estimated trade demand provided at the six production area meetings was 924,583 pounds, whereas the estimated handler trade demand ranged from 875,000 to 950,000 pounds. The average of sales over the last five years was 760,152 pounds.

(C) Salable quantity required from the 2008–2009 marketing year production—920,000 pounds. This figure is the difference between the estimated 2008–2009 marketing year trade demand (920,000 pounds) and the estimated carry-in on June 1, 2008 (0 pounds).

(D) Total estimated allotment base for the 2008–2009 marketing year—1,986,133 pounds. This figure represents a one percent increase over the revised 2007–2008 total allotment base. This figure is generally revised each year on June 1 because of producer base being lost to the bona fide effort production provisions of § 985.53(e). The revision is usually minimal.

(E) Computed allotment percentage—46.3 percent. This percentage is computed by dividing the required salable quantity by the total estimated allotment base.

(F) Recommended allotment percentage—50 percent. This

recommendation was based on the Committee's determination that the computed 46.3 percent would not adequately supply the potential 2008–2009 market.

(G) The Committee's recommended salable quantity—993,067 pounds. This figure is the product of the recommended allotment percentage and the total estimated allotment base.

(H) Estimated available supply for the 2008–2009 marketing year—993,067 pounds. This figure is the sum of the 2008–2009 recommended salable quantity (993,067 pounds) and the estimated carry-in on June 1, 2008 (0 pounds).

## (2) Class 3 (Native) Spearmint Oil

(A) Estimated carry-in on June 1, 2008—56,433 pounds. The Committee's estimated carry-in reflects anticipated increases to the salable quantity and allotment percentage that may be needed to meet demand during the remainder of the 2007–2008 marketing year.

(B) Estimated trade demand for the 2008–2009 marketing year—1,250,000 pounds. This figure was based on input from producers at the six Native spearmint oil production area meetings held in September 2007, as well as estimates provided by handlers and other meeting participants at the October 17, 2007, meeting. The average estimated trade demand provided at the six production area meetings was 1,241,667 pounds, whereas the handler estimate ranged from 1,200,000 pounds to 1,250,000 pounds.

(C) Salable quantity required from the 2008–2009 marketing year production—1,193,567 pounds. This figure is the difference between the estimated 2008–2009 marketing year trade demand (1,250,000 pounds) and the estimated carry-in on June 1, 2008 (56,433 pounds).

(D) Total estimated allotment base for the 2008–2009 marketing year—2,235,374 pounds. This figure represents a one percent increase over the revised 2007–2008 total allotment base. This figure is generally revised each year on June 1 because of producer base being lost to the bona fide effort production provisions of § 985.53(e). The revision is usually minimal.

(E) Computed allotment percentage—53.4 percent. This percentage is computed by dividing the required salable quantity by the total estimated allotment base.

(F) Recommended allotment percentage—53 percent. This was the Committee's recommendation based on the computed allotment percentage, the average of the computed allotment

percentage figures from the six production area meetings (53.7 percent), and input from producers and handlers at the October 17, 2007, meeting.

(G) The Committee's recommended salable quantity—1,184,748 pounds. This figure is the product of the recommended allotment percentage and the total estimated allotment base.

(H) Estimated available supply for the 2008–2009 marketing year—1,241,181 pounds. This figure is the sum of the 2008–2009 recommended salable quantity (1,184,748 pounds) and the estimated carry-in on June 1, 2008 (56,433 pounds).

The salable quantity is the total quantity of each class of spearmint oil, which handlers may purchase from, or handle on behalf of producers during a marketing year. Each producer is allotted a share of the salable quantity by applying the allotment percentage to the producer's allotment base for the applicable class of spearmint oil.

The Committee's recommended Scotch and Native spearmint oil salable quantities and allotment percentages of 993,067 pounds and 50 percent, and 1,184,748 pounds and 53 percent, respectively, are based on the Committee's goal of maintaining market stability by avoiding extreme fluctuations in supplies and prices, and the anticipated supply and trade demand during the 2008–2009 marketing year. The salable quantities are not expected to cause a shortage of spearmint oil supplies. Any unanticipated or additional market demand for spearmint oil, which may develop during the marketing year, can be satisfied by an increase in the salable quantities. Both Scotch and Native spearmint oil producers who produce more than their annual allotments during the 2008–2009 marketing year may transfer such excess spearmint oil to a producer with spearmint oil production less than their annual allotment or put it into the reserve pool before November 1, 2008.

This regulation is similar to regulations issued in prior seasons. Costs to producers and handlers resulting from this rule are expected to be offset by the benefits derived from a stable market and improved returns. In conjunction with the issuance of this final rule, USDA has reviewed the Committee's marketing policy statement for the 2008–2009 marketing year. The Committee's marketing policy statement, a requirement whenever the Committee recommends volume regulations, fully meets the intent of § 985.50 of the order. During its discussion of potential 2008–2009 salable quantities and allotment

percentages, the Committee considered: (1) The estimated quantity of salable oil of each class held by producers and handlers; (2) the estimated demand for each class of oil; (3) the prospective production of each class of oil; (4) the total of allotment bases of each class of oil for the current marketing year and the estimated total of allotment bases of each class for the ensuing marketing year; (5) the quantity of reserve oil, by class, in storage; (6) producer prices of oil, including prices for each class of oil; and (7) general market conditions for each class of oil, including whether the estimated season average price to producers is likely to exceed parity. Conformity with the USDA's "Guidelines for Fruit, Vegetable, and Specialty Crop Marketing Orders" has also been reviewed and confirmed.

The establishment of these salable quantities and allotment percentages will allow for anticipated market needs. In determining anticipated market needs, consideration by the Committee was given to historical sales, as well as changes and trends in production and demand. This rule also provides producers with information on the amount of spearmint oil that should be produced for the 2008–2009 season in order to meet anticipated market demand.

## Final Regulatory Flexibility Analysis

Pursuant to requirements set forth in the Regulatory Flexibility Act (RFA), the Agricultural Marketing Service (AMS) has considered the economic impact of this action on small entities. Accordingly, AMS has prepared this final regulatory flexibility analysis.

The purpose of the RFA is to fit regulatory actions to the scale of business subject to such actions in order that small businesses will not be unduly or disproportionately burdened. Marketing orders issued pursuant to the Act, and the rules issued thereunder, are unique in that they are brought about through group action of essentially small entities acting on their own behalf.

There are eight spearmint oil handlers subject to regulation under the order, and approximately 58 producers of Scotch spearmint oil and approximately 90 producers of Native spearmint oil in the regulated production area. Small agricultural service firms are defined by the Small Business Administration (SBA) (13 CFR 121.201) as those having annual receipts of less than \$6,500,000, and small agricultural producers are defined as those having annual receipts of less than \$750,000.

Based on the SBA's definition of small entities, the Committee estimates

that one of the eight handlers regulated by the order could be considered a small entity. Most of the handlers are large corporations involved in the international trading of essential oils and the products of essential oils. In addition, the Committee estimates that 19 of the 58 Scotch spearmint oil producers and 21 of the 90 Native spearmint oil producers could be classified as small entities under the SBA definition. Thus, a majority of handlers and producers of Far West spearmint oil may not be classified as small entities.

The Far West spearmint oil industry is characterized by producers whose farming operations generally involve more than one commodity, and whose income from farming operations is not exclusively dependent on the production of spearmint oil. A typical spearmint oil-producing operation has enough acreage for rotation such that the total acreage required to produce the crop is about one-third spearmint and two-thirds rotational crops. Thus, the typical spearmint oil producer has to have considerably more acreage than is planted to spearmint during any given season. Crop rotation is an essential cultural practice in the production of spearmint oil for weed, insect, and disease control. To remain economically viable with the added costs associated with spearmint oil production, most spearmint oil-producing farms fall into the SBA category of large businesses.

Small spearmint oil producers generally are not as extensively diversified as larger ones and as such are more at risk from market fluctuations. Such small producers generally need to market their entire annual allotment and do not have the luxury of having other crops to cushion seasons with poor spearmint oil returns. Conversely, large diversified producers have the potential to endure one or more seasons of poor spearmint oil markets because income from alternate crops could support the operation for a period of time. Being reasonably assured of a stable price and market provides small producing entities with the ability to maintain proper cash flow and to meet annual expenses. Thus, the market and price stability provided by the order potentially benefit the small producer more than such provisions benefit large producers. Even though a majority of handlers and producers of spearmint oil may not be classified as small entities, the volume control feature of this order has small entity orientation.

This final rule establishes the quantity of spearmint oil produced in the Far West, by class that handlers may purchase from, or handle for, producers

during the 2008–2009 marketing year. The Committee recommended this rule to help maintain stability in the spearmint oil market by avoiding extreme fluctuations in supplies and prices. Establishing quantities to be purchased or handled during the marketing year through volume regulations allows producers to plan their spearmint planting and harvesting to meet expected market needs. The provisions of §§ 985.50, 985.51, and 985.52 of the order authorize this rule.

Instability in the spearmint oil sub-sector of the mint industry is much more likely to originate on the supply side than the demand side. Fluctuations in yield and acreage planted from season-to-season tend to be larger than fluctuations in the amount purchased by buyers. Demand for spearmint oil tends to be relatively stable from year-to-year. The demand for spearmint oil is expected to grow slowly for the foreseeable future because the demand for consumer products that use spearmint oil will likely expand slowly, in line with population growth.

Demand for spearmint oil at the farm level is derived from retail demand for spearmint-flavored products such as chewing gum, toothpaste, and mouthwash. The manufacturers of these products are by far the largest users of mint oil. However, spearmint flavoring is generally a very minor component of the products in which it is used, so changes in the raw product price have no impact on retail prices for those goods.

Spearmint oil production tends to be cyclical. Years of large production, with demand remaining reasonably stable, have led to periods in which large producer stocks of unsold spearmint oil have depressed producer prices for a number of years. Shortages and high prices may follow in subsequent years, as producers respond to price signals by cutting back production.

The significant variability is illustrated by the fact that the coefficient of variation (a standard measure of variability; “CV”) of Far West spearmint oil production from 1980 through 2006 was about 0.23. The CV for spearmint oil grower prices was about 0.14, well below the CV for production. This provides an indication of the price stabilizing impact of the marketing order.

Production in the shortest marketing year was about 50 percent of the 26-year average (1.84 million pounds from 1980 through 2006) and the largest crop was approximately 167 percent of the 26-year average. A key consequence is that in years of oversupply and low prices the season average producer price of

spearmint oil is below the average cost of production (as measured by the Washington State University Cooperative Extension Service.)

The wide fluctuations in supply and prices that result from this cycle, which was even more pronounced before the creation of the marketing order, can create liquidity problems for some producers. The marketing order was designed to reduce the price impacts of the cyclical swings in production. However, producers have been less able to weather these cycles in recent years because of the increase in production costs. While prices have been relatively steady, the cost of production has dramatically increased which has caused a hesitation by producers to plant. Producers are also enticed by the prices of alternative crops and their lower cost of production.

In an effort to stabilize prices, the spearmint oil industry uses the volume control mechanisms authorized under the order. This authority allows the Committee to recommend a salable quantity and allotment percentage for each class of oil for the upcoming marketing year. The salable quantity for each class of oil is the total volume of oil that producers may sell during the marketing year. The allotment percentage for each class of spearmint oil is derived by dividing the salable quantity by the total allotment base.

Each producer is then issued an annual allotment certificate, in pounds, for the applicable class of oil, which is calculated by multiplying the producer's allotment base by the applicable allotment percentage. This is the amount of oil for the applicable class that the producer can sell.

On November 1 of each year, the Committee identifies any oil that individual producers have produced above the volume specified on their annual allotment certificates. This excess oil is placed in a reserve pool administered by the Committee.

There is a reserve pool for each class of oil that may not be sold during the current marketing year unless USDA approves a Committee recommendation to make a portion of the pool available. However, limited quantities of reserve oil are typically sold to fill deficiencies. A deficiency occurs when on-farm production is less than a producer's allotment. In that case, a producer's own reserve oil can be sold to fill that deficiency. Excess production (higher than the producer's allotment) can be sold to fill other producers' deficiencies. All of this needs to take place by November 1.

In any given year, the total available supply of spearmint oil is composed of

current production plus carry-over stocks from the previous crop. The Committee seeks to maintain market stability by balancing supply and demand, and to close the marketing year with an appropriate level of carryout. If the industry has production in excess of the salable quantity, then the reserve pool absorbs the surplus quantity of spearmint oil, which goes unsold during that year, unless the oil is needed for unanticipated sales.

Under its provisions, the order may attempt to stabilize prices by (1) limiting supply and establishing reserves in high production years, thus minimizing the price-depressing effect that excess producer stocks have on unsold spearmint oil, and (2) ensuring that stocks are available in short supply years when prices would otherwise increase dramatically. The reserve pool stocks grown in large production years are drawn down in short crop years.

An econometric model was used to assess the impact that volume control has on the prices producers receive for their commodity. Without volume control, spearmint oil markets would likely be over-supplied, resulting in low producer prices and a large volume of oil stored and carried over to the next crop year. The model estimates how much lower producer prices would likely be in the absence of volume controls.

The Committee estimated the trade demand for the 2008–2009 marketing year for both classes of oil at 2,170,000 pounds, and that the expected combined carry-in will be 56,433 pounds. This results in a combined required salable quantity of 2,113,567 pounds. Therefore, with volume control, sales by producers for the 2008–2009 marketing year will be limited to 2,177,815 pounds (the recommended salable quantity for both classes of spearmint oil).

The recommended salable percentages, upon which 2008–2009 producer allotments are based, are 50 percent for Scotch and 53 percent for Native. Without volume controls, producers would not be limited to these allotment levels, and could produce and sell additional spearmint. The econometric model estimated a \$1.40 decline in the season average producer price per pound (from both classes of spearmint oil) resulting from the higher quantities that would be produced and marketed without volume control. The surplus situation for the spearmint oil market that would exist without volume controls in 2008–2009 also would likely dampen prospects for improved producer prices in future years because of the buildup in stocks.

The use of volume controls allows the industry to fully supply spearmint oil markets while avoiding the negative consequences of over-supplying these markets. The use of volume controls is believed to have little or no effect on consumer prices of products containing spearmint oil and will not result in fewer retail sales of such products.

The Committee discussed alternatives to the recommendations contained in this rule for both classes of spearmint oil. The Committee discussed and rejected the idea of recommending that there not be any volume regulation for both classes of spearmint oil because of the severe price-depressing effects that would occur without volume control.

The Committee considered various alternative levels of volume control for Scotch spearmint oil, including increasing the percentage to a less restrictive level, or decreasing the percentage. After considerable discussion the Committee unanimously determined that 993,067 pounds and 50 percent would be the most effective salable quantity and allotment percentage, respectively, for the 2008–2009 marketing year.

The Committee also considered various alternative levels of volume control for Native spearmint oil. After considerable discussion the Committee unanimously determined that 1,184,748 pounds and 53 percent would be the most effective salable quantity and allotment percentage, respectively, for the 2008–2009 marketing year.

As noted earlier, the Committee's recommendation to establish salable quantities and allotment percentages for both classes of spearmint oil was made after careful consideration of all available information, including: (1) The estimated quantity of salable oil of each class held by producers and handlers; (2) the estimated demand for each class of oil; (3) the prospective production of each class of oil; (4) the total of allotment bases of each class of oil for the current marketing year and the estimated total of allotment bases of each class for the ensuing marketing year; (5) the quantity of reserve oil, by class, in storage; (6) producer prices of oil, including prices for each class of oil; and (7) general market conditions for each class of oil, including whether the estimated season average price to producers is likely to exceed parity. Based on its review, the Committee believes that the salable quantity and allotment percentage levels recommended will achieve the objectives sought.

Without any regulations in effect, the Committee believes the industry would return to the pronounced cyclical price

patterns that occurred prior to the order, and that prices in 2008–2009 would decline substantially below current levels.

As stated earlier, the Committee believes that the order has contributed extensively to the stabilization of producer prices, which prior to 1980 experienced wide fluctuations from year-to-year. National Agricultural Statistics Service records show that the average price paid for both classes of spearmint oil ranged from \$4.00 per pound to \$11.10 per pound during the period between 1968 and 1980. Prices have been consistently more stable since the marketing order's inception in 1980, with an average price for the period from 1980 to 2006 of \$12.69 per pound for Scotch spearmint oil and \$9.89 per pound for Native spearmint oil.

According to the Committee, the recommended salable quantities and allotment percentages are expected to achieve the goals of market and price stability.

As previously stated, annual salable quantities and allotment percentages have been issued for both classes of spearmint oil since the order's inception. Reporting and recordkeeping requirements have remained the same for each year of regulation. These requirements have been approved by the Office of Management and Budget under OMB Control No. 0581–0178, Vegetable and Specialty Crops. Accordingly, this action will not impose any additional reporting or recordkeeping requirements on either small or large spearmint oil producers and handlers. As with all Federal marketing order programs, reports and forms are periodically reviewed to reduce information requirements and duplication by industry and public sector agencies.

The AMS is committed to complying with the E-Government Act, to promote the use of the Internet and other information technologies to provide increased opportunities for citizen access to Government information and services, and for other purposes.

As noted in the initial regulatory flexibility analysis, USDA has not identified any relevant Federal rules that duplicate, overlap, or conflict with this final rule.

In addition, the Committee's meeting was widely publicized throughout the spearmint oil industry and all interested persons were invited to attend the meeting and participate in Committee deliberations on all issues. Like all Committee meetings, the October 17, 2007, meeting was a public meeting and all entities, both large and small, were able to express views on this issue.

A proposed rule concerning this action was published in the **Federal Register** on February 15, 2008 (73 FR 8825). Copies of the rule were provided to Committee staff, which in turn made it available to spearmint oil producers, handlers, and other interested persons. Finally, the rule was made available through the Internet by USDA and the Office of the **Federal Register**. A 30-day comment period, ending March 17, 2008, was provided to allow interested persons to respond to the proposal. No comments were received.

A small business guide on complying with fruit, vegetable, and specialty crop marketing agreements and orders may be viewed at: <http://www.ams.usda.gov/fv/moab.html>. Any questions about the compliance guide should be sent to Jay Guerber at the previously mentioned address in the **FOR FURTHER INFORMATION CONTACT** section.

After consideration of all relevant matter presented, including the information and recommendation submitted by the Committee and other available information, it is hereby found that this rule, as hereinafter set forth, will tend to effectuate the declared policy of the Act.

#### List of Subjects in 7 CFR Part 985

Marketing agreements, Oils and fats, Reporting and recordkeeping requirements, Spearmint oil.

■ For the reasons set forth in the preamble, 7 CFR Part 985 is amended as follows:

#### PART 985—MARKETING ORDER REGULATING THE HANDLING OF SPEARMINT OIL PRODUCED IN THE FAR WEST

■ 1. The authority citation for 7 CFR part 985 continues to read as follows:

**Authority:** 7 U.S.C. 601–674.

■ 2. A new § 985.227 is added to read as follows:

[**Note:** This section will not appear in the Code of Federal Regulations.]

#### § 985.227 Salable quantities and allotment percentages—2008–2009 marketing year.

The salable quantity and allotment percentage for each class of spearmint oil during the marketing year beginning on June 1, 2008, shall be as follows:

(a) Class 1 (Scotch) oil—a salable quantity of 993,067 pounds and an allotment percentage of 50 percent.

(b) Class 3 (Native) oil—a salable quantity of 1,184,748 pounds and an allotment percentage of 53 percent.

Dated: April 15, 2008.

**Lloyd C. Day,**

*Administrator, Agricultural Marketing Service.*

## DEPARTMENT OF TRANSPORTATION

### Federal Aviation Administration

#### 14 CFR Part 39

[Docket No. FAA–2008–0197 Directorate Identifier 2008–CE–005–AD; Amendment 39–15467; AD 2008–08–15]

**RIN 2120–AA64**

**Airworthiness Directives; DORNIER LUFTFAHRT GmbH Models 228–100, 228–101, 228–200, 228–201, 228–202, and 228–212 Airplanes**

**AGENCY:** Federal Aviation Administration (FAA), Department of Transportation (DOT).

**ACTION:** Final rule.

**SUMMARY:** We are adopting a new airworthiness directive (AD) for the products listed above. This AD results from mandatory continuing airworthiness information (MCAI) issued by an aviation authority of another country to identify and correct an unsafe condition on an aviation product. The MCAI describes the unsafe condition as:

The manufacturer reported findings of missing primer on the internal of the elevator and rudder of aircraft S/N 8200. The aircraft S/N 8200 was with RUAG for maintenance purposes. Investigation performed by RUAG showed that the paint removal procedure for the rudder and elevator was changed from a paint stripping with brush and scraper to a procedure where the parts were submerged in a tank filled with hot liquid stripper. The stripper is called TURCO 5669 from Henkel Surface Technologies. The stripping process is described in the Technical Process Bulletin No. 238799 dated 09/01/1999. This paint stripping process change was not communicated to and not approved by the TC-Holder.

We are issuing this AD to require actions to correct the unsafe condition on these products.

**DATES:** This AD becomes effective May 27, 2008.

On May 27, 2008, the Director of the Federal Register approved the incorporation by reference of certain publications listed in this AD.

**ADDRESSES:** You may examine the AD docket on the Internet at <http://www.regulations.gov> or in person at Document Management Facility, U.S. Department of Transportation, Docket

Operations, M–30, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue, SE., Washington, DC 20590.

**FOR FURTHER INFORMATION CONTACT:** Karl Schletzbaum, Aerospace Engineer, FAA, Small Airplane Directorate, 901 Locust, Room 301, Kansas City, Missouri 64106; telephone: (816) 329–4146; fax: (816) 329–4090.

#### SUPPLEMENTARY INFORMATION:

##### Discussion

We issued a notice of proposed rulemaking (NPRM) to amend 14 CFR part 39 to include an AD that would apply to the specified products. That NPRM was published in the **Federal Register** on February 25, 2008 (73 FR 9965). That NPRM proposed to correct an unsafe condition for the specified products. The MCAI states:

The manufacturer reported findings of missing primer on the internal of the elevator and rudder of aircraft S/N 8200. The aircraft S/N 8200 was with RUAG for maintenance purposes. Investigation performed by RUAG showed that the paint removal procedure for the rudder and elevator was changed from a paint stripping with brush and scraper to a procedure where the parts were submerged in a tank filled with hot liquid stripper. The stripper is called TURCO 5669 from Henkel Surface Technologies. The stripping process is described in the Technical Process Bulletin No. 238799 dated 09/01/1999. This paint stripping process change was not communicated to and not approved by the TC-Holder.

##### Comments

We gave the public the opportunity to participate in developing this AD. We received no comments on the NPRM or on the determination of the cost to the public.

##### Conclusion

We reviewed the available data and determined that air safety and the public interest require adopting the AD as proposed.

##### Differences Between This AD and the MCAI or Service Information

We have reviewed the MCAI and related service information and, in general, agree with their substance. But we might have found it necessary to use different words from those in the MCAI to ensure the AD is clear for U.S. operators and is enforceable. In making these changes, we do not intend to differ substantively from the information provided in the MCAI and related service information.

We might also have required different actions in this AD from those in the MCAI in order to follow FAA policies.
