*Needs and Uses:* Tens of thousands of Marines transition from the military to civilian life each year, the majority of whom have been exposed to deployment stressors that have put them at high risk for stress-related disorders. This longitudinal study builds on a 2008 pilot study assessing the prevalence of mental health outcomes among Sailors and Marines transitioning from the Service, and identifying predictors of and changes in mental health and resilience over time. For the baseline component of the current study, a paper-and-pencil questionnaire was administered to approximately 2,700 active-duty Marines in the Transition Assistance Program (TAP) during routine mandatory separation counseling via group administration at 6 selected installations worldwide. Based on the estimated number of attendees per TAP class and the number of classes conducted during the 4-month data collection period (January-April 2010), we estimate that approximately 4,900 Marines were eligible for inclusion into the study, giving us an approximate 55 percent response rate. The baseline survey included selected items from the post-deployment health reassessment (PDHRA), along with additional
