No. E-064-2004/0-JP-15), all entitled "Use of Leptin for Treating Human Lipodystrophy and Method of Determining Predisposition to Said Treatment", to

Amylin Pharmaceuticals, Inc., having a place of business in San Diego, California, U.S.A. The patent rights in this invention have been assigned to the United States of America, the University of Texas Southwestern Medical Center at Dallas, and Amgen, Inc.

The contemplated exclusive license territory may be worldwide, and the field of use may be limited to "use of leptin and leptin analogs for the treatment of lipodystrophy or a metabolic condition associated with lipodystrophy in humans, including lipodystrophy associated with or secondary to HIV infection".

DATES: Only written comments and/or application for a license which are received by the NIH Office of Technology Transfer on or before August 27, 2010 will be considered.

ADDRESSES: Requests for copies of the patents, inquiries, comments, and other materials relating to the contemplated license should be directed to: Tara L. Kirby, PhD, Senior Licensing and Patenting Manager, Office of Technology Transfer, National Institutes of Health, 6011 Executive Boulevard, Suite 325, Rockville, MD 20852-3804; Telephone: 301-435-4426; Facsimile: 301-402-0220; E-mail: tarak@mail.nih.gov.

SUPPLEMENTARY INFORMATION: This technology relates to leptin, a protein hormone that plays a key role in regulating energy intake and expenditure. This hormone is released from adipose tissue and inhibits appetite in the brain by counteracting peptide hormones responsible for stimulating hunger, and also stimulates the synthesis of another peptide hormone, α -MSH, which acts as an appetite suppressant.

Lipodystrophy, a disorder characterized by pathological deposition of adipose tissue (fat), is caused by a deficiency or complete absence of leptin. Patients with severe lipodystrophy have abnormalities in adipose tissue distribution with loss of subcutaneous fat, and suffer from multiple metabolic disorders—extreme insulin resistance, very high triglyceride levels, diabetes and steatosis (fat accumulation in tissues like liver and muscle)—that are associated with increased risk of severe pancreatitis, early diabetes complications, cirrhosis and early cardiovascular death. Leptin replacement therapy in such patients leads to clear and dramatic metabolic benefits, including a reduction in insulin resistance and triglyceride levels, which are refractory to other treatment.

This technology relates to the use of leptin, a leptin analog, or a leptin derivative to treat lipodystrophy, as well as methods and kits for determining a predisposition of a lipodystrophic patient to respond to treatment with leptin, a leptin analog, or a leptin derivative.

The prospective exclusive license will be royalty-bearing and will comply with the terms and conditions of 35 U.S.C. 209 and 37 CFR 404.7. The prospective exclusive license may be granted unless, within 30 days from the date of this published Notice, the NIH receives written evidence and argument that establishes that the grant of the license would not be consistent with the requirements of 35 U.S.C. 209 and 37 CFR 404.7.

Applications for a license in the prospective field of use filed in response to this notice will be treated as objections to the grant of the contemplated exclusive license. Comments and objections submitted in response to this notice will not be made available for public inspection, and, to the extent permitted by law, will not be released under the Freedom of Information Act, 5 U.S.C. 552.

Dated: July 22, 2010.

Richard U. Rodriguez,

Director, Division of Technology Development and Transfer, Office of Technology Transfer, National Institutes of Health.
