

alternative, as described below: Alternative A would leave in place the current tide control structure at Chequessett Neck Road and continue management of the estuary without restoration.

Alternative B would employ an adaptive management strategy to restore tides in the lower reach of the Herring River up to a maximum high tide of approximately six feet. At this tide level flood mitigation of sensitive properties can be achieved without a secondary dike at Mill Creek.

Alternative C would employ an adaptive management strategy to restore tides up to the maximum Chequessett Neck Road dike capacity (10 foot vertical tide gate opening) with a new dike at Mill Creek that blocks all tidal influence. This alternative would maximize restoration in all sub-basins except Mill Creek. Mill Creek would remain unrestored, but no new flood proofing measures would be needed in Mill Creek.

Alternative D would employ an adaptive management strategy to restore tides up to the maximum Chequessett Neck Road dike capacity (10 foot vertical tide gate opening) with a new dike at Mill Creek. Mill Creek tides would be controlled by this secondary structure to the same level as that of Alternative B, the maximum level that can be achieved after flood proofing several low-lying properties. Tidal restoration would be maximized in all other sub-basins.

For Alternatives B and D, two options are considered for mitigating project impacts to the Chequessett Yacht & Country Club (CYCC) golf course, a private golf course in Mill Creek: (1) Raise low-lying fairways a minimum of two feet above proposed inundation levels, or (2) relocate low-lying fairways to an undeveloped upland area owned by CYCC.

Alternative D, with the option to raise existing low-lying fairways a minimum of two feet above proposed inundation levels, has been identified as the NPS Preferred Alternative. This alternative best fulfills the restoration objectives of the project while mitigating adverse impacts to developed properties.
