

along a prescribed underground path. During this process, drilling fluid, bentonite clay, and water will be continuously pumped into the hole to remove cuttings and maintain the integrity of the hole. Bentonite is composed of natural clay minerals. Once the hole has been drilled, a prefabricated segment of pipe will be attached behind a reaming tool on the exit side of the crossing and pulled back through the drill hole to the drill rig, completing the crossing. The time required to complete the HDD is anticipated to be approximately 3–5 weeks, including setup, drilling time, pull-back, cleanup, and demobilization. Actual time drilling under the Refuge lands is estimated at 1 week.
