

to determine sex ratios, proportion of wild versus hatchery origin, gather scales for age determination and life history strategy, and to obtain fin clips for genetic analysis. Ultimately, these data are being used to guide the placement of hatchery reared CCC coho salmon smolts intended to improve weak or lost year classes in these systems. Requested unintentional mortality for juveniles and smolts of both species is two percent and there is no unintentional mortality requested for adults.

Project 2 involves seasonal sampling of CCC steelhead and CCC coho salmon in Pescadero and San Gregorio creek lagoons to determine their abundance (using mark and recapture techniques), growth rates, and to determine smolt and adult life history information from scales. Sampling in late summer and fall will provide information on relative abundance and growth rates while sampling in spring will provide information on smolt abundance and growth during their rearing phase the previous year as well as the spring of their outmigration. Scales collected from a sub-sample of smolt and adult steelhead will be used to provide an index of where they reared as juveniles and to determine age and growth rates. This project also includes creel surveys at Pescadero Lagoon in order to collect scales and length measurements of adult CCC steelhead captured by fisherman during the catch and release fishing season. Data gathered from this project will contribute to the overall understanding and importance of lagoon habitats for these species. In particular, data gathered from Pescadero Lagoon may provide federal and state agencies with important information on the year-to-year impact of re-occurring fish kills during sand bar breach events on the overall production of salmonids in this system. Requested unintentional mortality for juveniles and smolts of both species is two percent and there is no unintentional mortality requested for adults.
