

measured, weighed, sampled for genetic tissue analysis, and PIT tagged. Additionally, up to five adults from each river and Albemarle Sound would be captured, anesthetized, and implanted with an internal sonic transmitter. Manual tracking and passive detections of telemetered fish at fixed receiver stations would provide information about movements and habitat use. Recaptures of tagged fish may also be used to produce abundance estimates if appropriate. Information gained about sturgeon presence, abundance and distribution would be used to guide future efforts to restore or protect key habitats.

SUPPLEMENTARY INFORMATION: The subject permit is requested under the authority of the Endangered Species Act of 1973, as amended (ESA; 16 U.S.C. 1531 *et seq.*) and the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR 222-226).

The applicant has requested a permit to test commercial gillnet gear that may have the potential to eliminate or reduce sea turtle bycatch. The research would involve testing modified large mesh (≤ 5 inches) commercial gillnets targeting southern flounder (*Paralichthys lethostigma*) in shallow waters of Core Sound, North Carolina. Test nets would be configured with illuminated, green Lindgen-Pitman Electralume lights that have shown promise for reducing sea turtle bycatch in another location. Two contracted commercial gillnet vessels would conduct a total of sixty fishing trips, setting five matched (control vs. experimental) sets of gillnets each day. Each matched set would consist of 100 yards of control net (gillnet without illuminated lights) and 100 yards of experimental net (gillnet with illuminated lights), for a total of 1,000 yards of net a day. With the exception of the lights, the gillnets would be identical in all other respects (e.g., twine material/size; hanging ration; stretch mesh). To follow fishing protocols, nets would be set at dusk and retrieved in the early morning. Turtles would be identified to species, measured, photographed, and flipper and PIT tagged. Captured sea turtles would be examined for any possible injuries before being released away from fishing area. Any comatose or debilitated turtles would be transported to a rehabilitation center. During the life of the permit, the applicant requests authorization to capture 18 Kemp's

ridley (*Lepidochelys kempii*), 15 loggerhead (*Caretta caretta*), 31 green (*Chelonia mydas*), 2 hawksbill (*Eretmochelys imbricata*), and 2 leatherback (*Dermochelys coriacea*) sea turtles. Of the captured turtles, 5 Kemp's ridleys, 5 loggerheads, 15 greens, 2 hawksbills, and 2 leatherbacks may be mortalities. The permit would expire in December 2011.
