II. What Action is the Agency Taking?

The preliminary organophosphorous cumulative risk assessment is being made available for comment. The assessment represents a new way of analyzing data about potential exposure to pesticides. The Agency's methods result in measurements of the probability of exposure to more than one organophosphorous pesticide and an assessment of such combined exposure. While EPA is interpreting the results of these analyses and the soundness of these methods, it is too soon to draw firm conclusions about risks or consider risk management possibilities. The risk mitigation measures that have already been taken on individual members of this group of pesticides have led to significant reduction in potential risk,

and EPA is continuing to address risks as they are identified. The Agency has confidence in the methods used to generate the results given the numerous scientific reviews conducted before completion of this preliminary cumulative risk assessment. Based on this analysis, EPA continues to have confidence in the overall safety of our food supply and emphasizes the importance of eating a varied diet rich in fruits and vegetables. Pesticide residues in drinking water do not appear to be a major contributor to risk. Although most indoor uses of organophosphorous pesticides have been eliminated through earlier risk reduction actions, a few remaining uses may be re-evaluated.
